Reversium by 3Sci Labs

Feature list / Build 0.26.0 / 2026-10-20

Understand your delivery

Guided Start flow / Browser + local

Choose an outcome, select your ZIP and follow findings to next steps.

Limit: No installation is needed for browser analysis.

ZIP inventory and platform clues / Browser + local

See inspected languages, files, manifests, runtimes and referenced services.

Limit: Clues do not prove the whole deployed platform is present.

Plain-language findings / Browser + local

Read supported feature explanations with evidence and unknowns.

Limit: The analyzer cannot tell you exactly everything an application does.

Source tracing / Browser + local

Follow selected Python and JavaScript/TypeScript routes, React props/callbacks, computed API targets and Supabase data references.

Limit: Bounded static readers; dynamic paths and unsupported patterns can remain unresolved.

Binary clues / Browser + local

Inspect supported executable/container metadata, strings and target clues.

Limit: Not full decompilation or reconstruction.

File alerts / Browser + local

Review green, yellow and red signals, selected ZIP integrity checks and suspicious patterns.

Limit: Green is not a safety certificate; not antivirus or a complete vulnerability audit.

Feature list / Build 0.26.0 / 2026-10-20

See relationships and changes

Workflow paths / Browser + local

Follow supported screen-to-callback-to-API-to-data candidate paths.

Limit: Static connections do not establish permissions, runtime conditions or success.

Graphical feature map / Browser + local

Focus a feature, inspect nodes and edges and save the visible SVG.

Limit: View capped at 120 nodes and 240 edges; omissions are disclosed.

Imports and dependencies / Browser + local

Explore candidate file/module and referenced-package relationships.

Limit: Not a full runtime call graph; drawn import view shows first 100 unique edges.

Evidence and coverage / Browser + local

Search source locations and see inspected, unresolved and omitted material.

Limit: Coverage describes this inspection; it is not test coverage.

Compare deliveries / Browser + local

Compare saved reports for file, finding and feature-map relationship changes.

Limit: Analyzer-version changes can affect output; differences do not prove behavior changed.

Candidate change impact / Browser + local

Explore bounded upstream/downstream neighbors before maintenance.

Limit: Potentially affected components need developer confirmation.

Feature list / Build 0.26.0 / 2026-10-20

Prepare and share a handover

Setup and supporting-service clues / Browser + local

Collect runtime names, configuration names, migrations, scripts and operation questions.

Limit: No live service connection, production permissions or cost verification.

Saved handover checklist / Browser + local

Assign owners, statuses and notes; restore a matching saved checklist.

Limit: Reviewer status is a human claim; notes need a separate save.

Report exports / Browser + local

Save HTML/JSON/SVG or one local handover ZIP with reports, maps, a developer first-hour brief, checklist and remaining questions.

Limit: Source code is separate. Notes and test records are opt-in; restore checklist notes explicitly. Not an installation guide or runtime proof.

AI-to-AI handover / Manual workflow

Give a developer using another coding tool a report, evidence, gaps and the original authorized code package.

Limit: Does not transfer chat history, hidden prompts, credentials or provider sessions.

Online AI request preparation / Manual handoff

Select up to 20 findings, edit the exact request and choose whether to share it with an AI provider.

Limit: Embedded online ChatGPT account access remains disabled pending approval.

Local optional AI / Local + account eligibility

Use the existing optional account connection and review evidence before each request.

Limit: Separate setup, network and provider limits apply; sign-in is not proof of inference access.

Feature list / Build 0.26.0 / 2026-10-20

Verify carefully and keep control

Browser-local analysis / Browser

Read your ZIP in device memory without uploading or executing its contents.

Limit: Hosting sees normal app requests; optional AI sharing is a separate deliberate action. 32 MiB compressed input.

Local application and CLI / Local

Analyze locally with Python; release smoke checks verify public file/version consistency without sending user data.

Limit: File checks are not UI coverage. Local web input limit is 64 MiB; archive bounds still apply.

Sandbox preparation / Local developer workflow

Check host prerequisites and prepare offline VM profiles without launching input code.

Limit: Preparation is not proof of isolation or application compatibility.

Experimental sandbox execution / Fixed reviewed profile

Run real builds and selected tests in a disposable offline QEMU Linux guest with synthetic settings.

Limit: Windows pilot only; not general Run ZIP. A developer must review and adapt any other project.

Disposable service and CMS pilot / Fixed reviewed profile

Use guest-local database, login and storage, plus a guarded serial browser preview for the example profile.

Limit: Image upload passed; reviewer queue was empty, so photo approval/publication remains unverified.

Exact-package runtime records / Browser + local review

Attach a matching ZIP fingerprint record and keep runtime outcomes separate from static clues.

Limit: Editable unsigned reviewer evidence; no automatic certification or checklist verification.
